

Paxos summary

Why use proposal numbers?

- If all requests come from one proposer (leader) then Paxos is trivial
 We would simply send a message to all the acceptors we can reach
 Get a response from the majority
- A leader can fail Paxos handles the case where multiple proposers might think they are the leader
- Multiple proposers will not lead to inconsistencies
- Each proposer uses a unique proposal #
- Proposals are ordered: newer (higher #) proposals take precedence over older ones
- Acceptor tells it whether it has already accepted a higher numbered proposal
- Why do we need a majority of acceptors?
- Once a value has been accepted by a majority of acceptors, if any acceptor crashes, at least one acceptor still has the latest (highest) state.

Question 2 (Paxos) Question 1 – Discussion When does a proposer have to change the value that it is proposing during the Paxos consensus protocol? Why can an acceptor not necessarily accept the first value it receives but must sometimes accept different values? If each acceptor just accepts a proposed value, it is possible that no A proposer sends a value to an acceptor (with a prepare message) acceptors get a majority of any proposed value Multiple proposers may do this concurrently and send different va Acceptors therefore have to be able to accept different values – they may Acceptors respond to a prepare request from a proposer with the highest have to change their mind numbered proposal that they accepted if another proposal has already been - They cannot accept every proposed value because then multiple values accepted If multiple requests came in concurrently, an acceptor may have seen a higher number. It responds to each proposer with that higher number could be chosen - Once a value has been chosen, a new proposer has to abandon its value and use a previously chosen value A proposer **must** ask for that value to be accepted even if it initially proposed · We need a 2 phase protocol: phase 1 asks the acceptor for chosen values before a different value. The proposer is the one who figures out the highest accepted proposal from all acceptors and propagates that information to all acceptors. proposing a value Any competing proposals have to be aborted This does not violate the requirement of consensus since the algorithm selects one of the This is done by forcing an order: higher numbered (newer) proposals will take precedence over lower-numbered (older) proposals proposed values. © 2018 Paul Krz

Question 3 (Raft) Question 3 – Longer Answer Raft uses a single leader (one server is elected as a leader). Explain how Raft performs leader election. Raft uses a single leader (one server is elected as a leader). Explain how Raft performs leader election. To start an election, a candidate votes for itself and sends a request vote Short answer: message to all other servers. Other servers that have not yet voted and receive the request acknowledge the candidate to be the leader. Each server that Each candidate starts a random timer before proposing receives a request will vote for at most one candidate. itself as a leader & sending election messages to the If the candidate receives a majority of acknowledgements, it becomes the leader. group. If the candidate does not win or lose an election, it times out and starts a new If you receive a leader proposal message and you have not election. Randomized timeouts are used to ensure that split votes happen rarely. yet proposed yourself, you will acknowledge that candidate To support recovery and avoid stale state, a "term number" is incremented after and not vote for yourself. each election If a candidate gets majority votes, it becomes the leader. If the candidate receives a heartbeat from another server and that leader's term # is at least as large as the candidate's current term, then the candidate recognizes the leader as legitimate and becomes a follower. © 2018 Paul Krzyz er 22, 2018 ctober 22, 2018

Question 4 (Raft)

An elected leader takes client requests. Each request is essentially a log entry that will be replicated among the servers. When is a log entry committed in Raft?

A log entry is committed once the leader that created the entry has replicated it on a majority of the servers.

<u>Committed</u> means that the log entry is applied to the state machine.
